

A very short manual on installation and usage of the J2EE Design Pattern Generator plugin.

1. To install the plugin just copy the contents of the downloaded zip file (j2ee-dp-gen_v_1.1.zip or a newer release) to the Eclipse root directory (where the “plugins” directory is).
2. To check, if the plugin works successfully start Eclipse and open File->New->Other (or Ctrl + N). In the wizard you should see a “ Design Pattern Generator” category containing six design pattern names.
3. To generate a pattern choose a desired pattern name and press “Next” in the wizard.
4. To use the refactorings, select any Java file in the Package Explorer and open the context menu (right click). In the menu you will see a category “J2EE refactoring”.
